

“ DEK ”

Product Type:

Deoxidising pickling acid for aluminium
SCTECNDE/001 Rev.0

Product Category:

SCALE REMOVERS – PICKLING AGENTS - Professional Use Only

Description:

Temporiti srl has many years experience of beam maintenance for the textile industry which led to the development of this formulation.

We have developed DEK to give our customers a product that offers an alternative to anodic oxidation to successfully inhibit the continuous build-up of the oxide layer which is typical of aluminium.

Temporiti DEK works by dissolving the oxide that forms when the metal comes into contact with air and/or water, returning the metal to its original appearance and reducing the accumulation of oxide on the wire in contact with the flange.

Instructions:

Dilute the product according to its intended use and in compliance with the following instructions.

Immersion: use a dilution of 1:2 to 1:1 (1 part DEK and 1 or 2 parts water), according to the amount of oxide to be removed. First clean the surfaces with Temporiti SMAK, and then to apply to the flanges with a cloth whilst the beam is rotating.

Wait a few seconds until the surfaces are completely dry, and then continue warping.

We recommend testing the product first to see how it can be most suitably used.

FOR PROFESSIONAL USE ONLY.

The company declines any and all responsibility for improper use of the product.
